

Hablyra UI redesign — before / after

Visual and layout redesign of the existing Compose Multiplatform app. Behaviour, data model and queries stay unchanged. Values follow docs/DESIGN_SYSTEM.md; this document adds the layout decisions it leaves open. Full written spec: export/HABLYRA_REDESIGN_HANDOFF.md.

Direction Calm cards, the interrupted loop as streak visual, bottom navigation with four tabs.	Unchanged Domain model, SQLDelight queries, formatters, existing English strings.	Needs approval Bottom navigation, five new chart/calendar tokens, Settings surface.
--	---	---

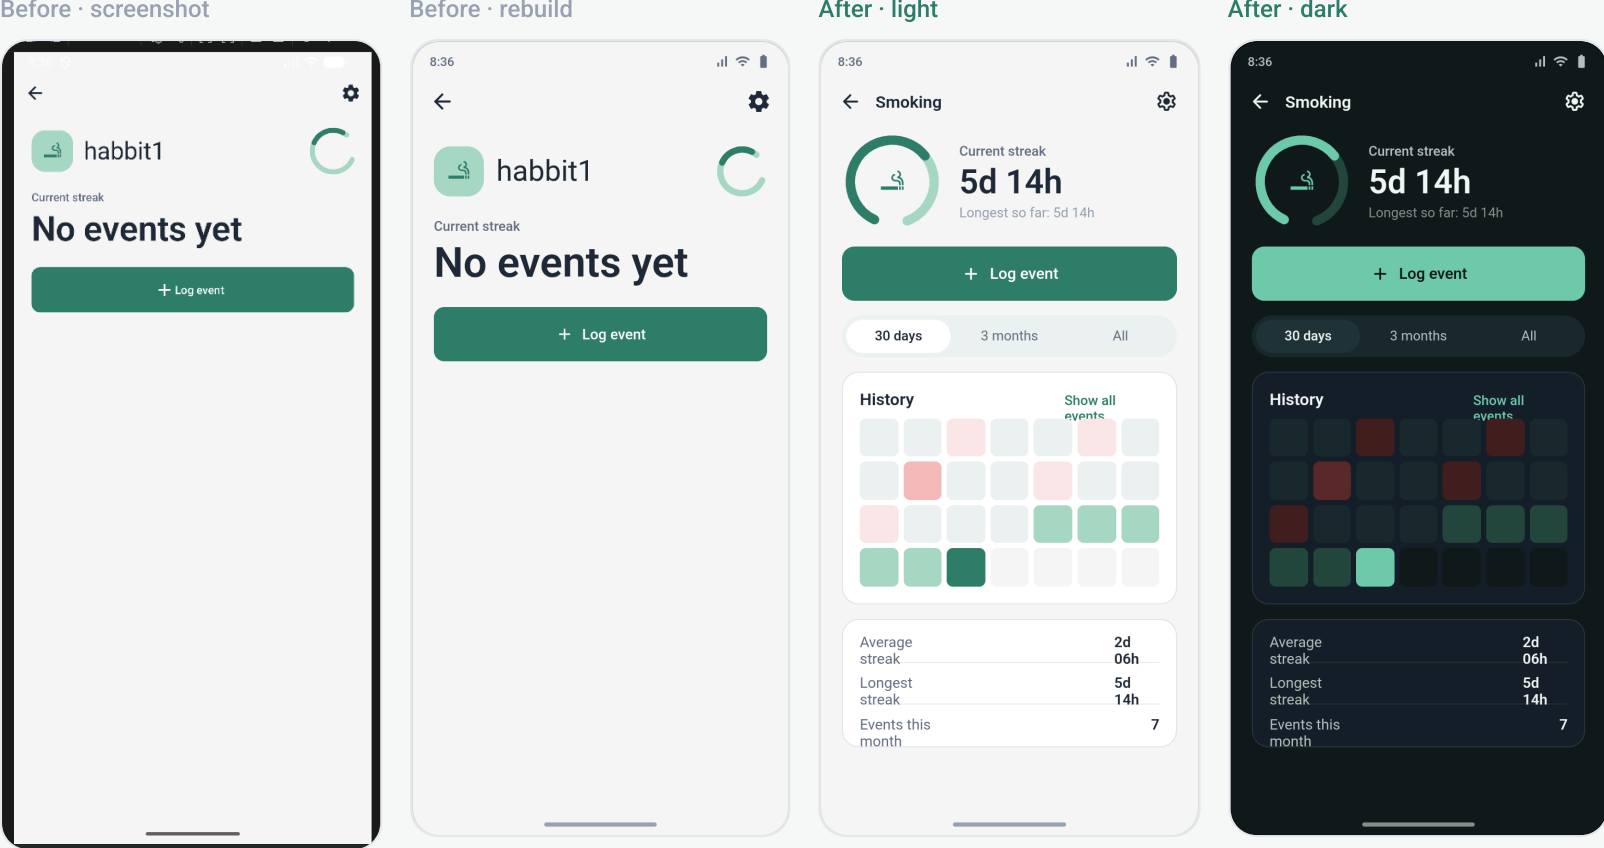

01 Dashboard (Habits tab)

Card becomes a vertical block: identity row → streak value → 14-day rhythm strip → tonal log button. New week summary card on brandPrimary. The filled per-card button is gone so the FAB is the only filled action.

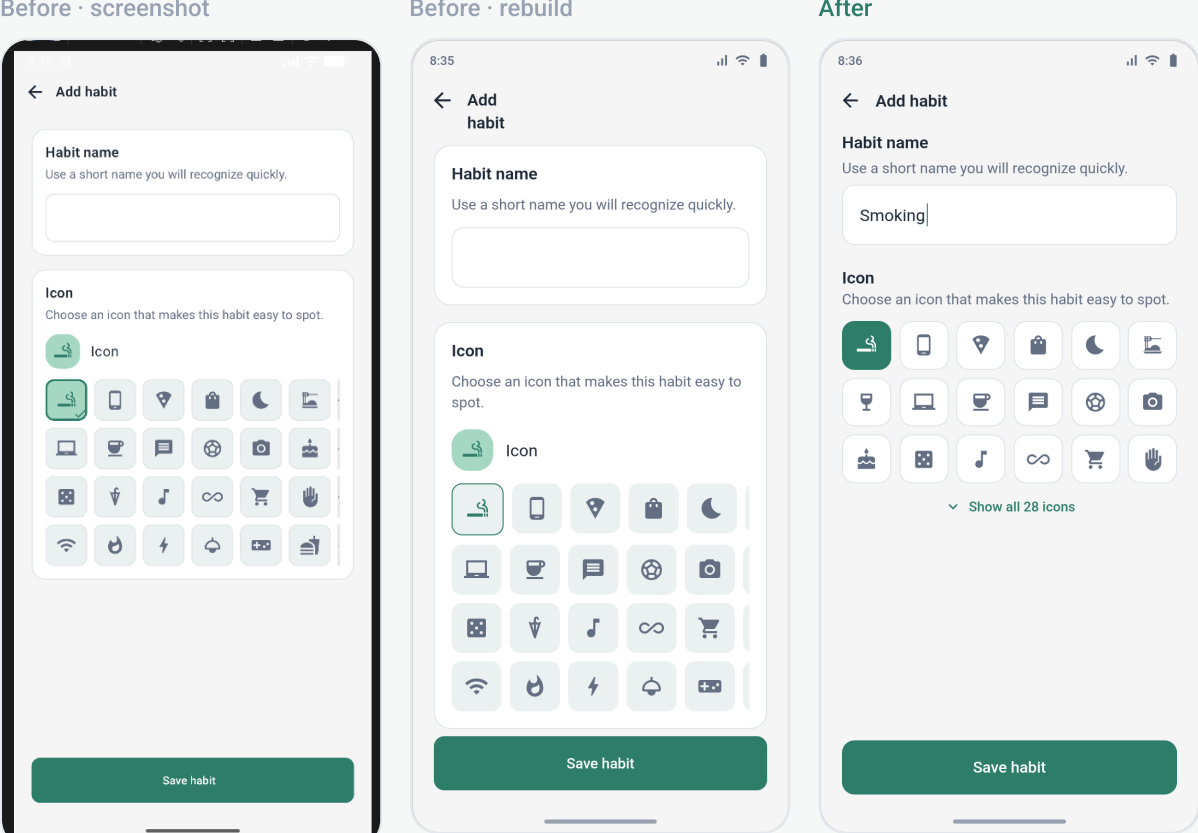

02 Habit details

LoopMark becomes the streak display (progress = current ÷ longest). One filled action, a 30 days / 3 months / All segmented control scoping calendar and statistics, statistics as a divided list. Histogram moves to Insights.

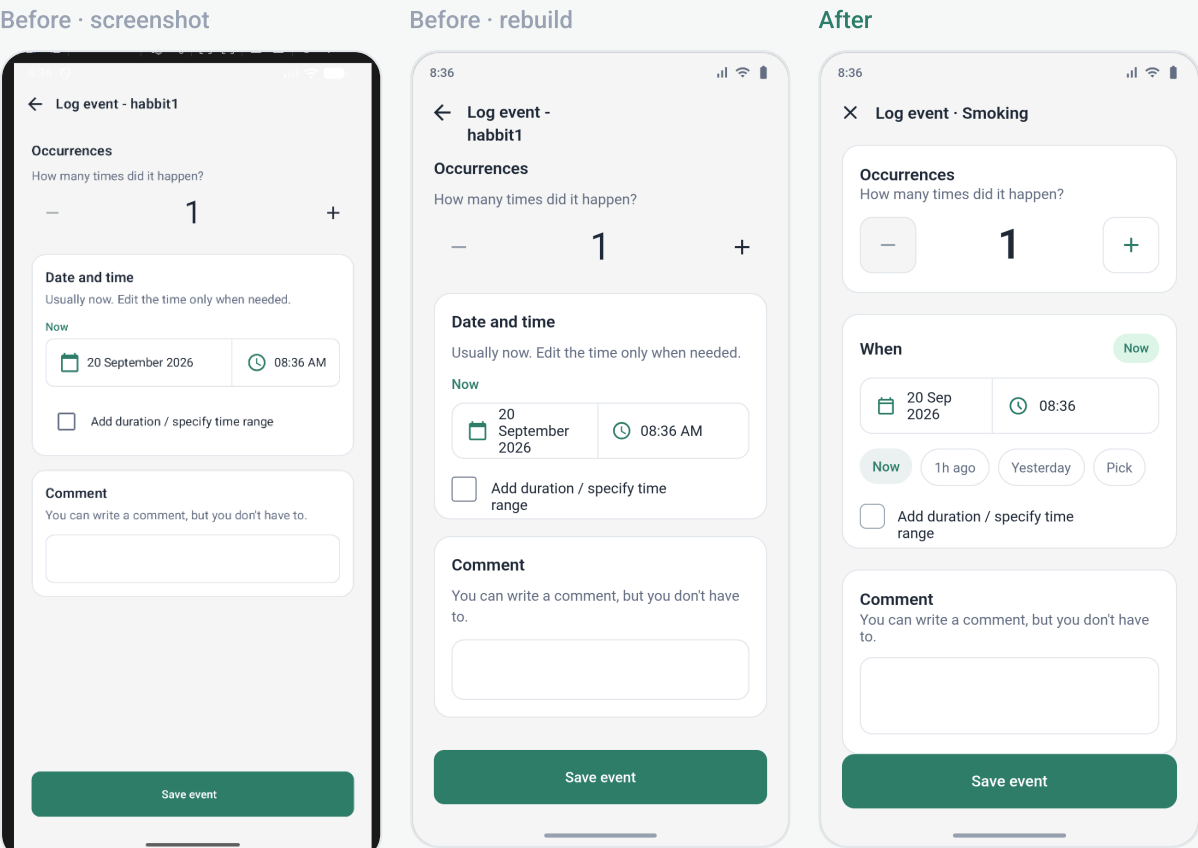

03 Add habit

Sections sit on the background instead of inside cards. Icon grid becomes 6 full-width columns (the current 7×48dp row is cut off on a 360dp screen), first 18 shown with an expand row.

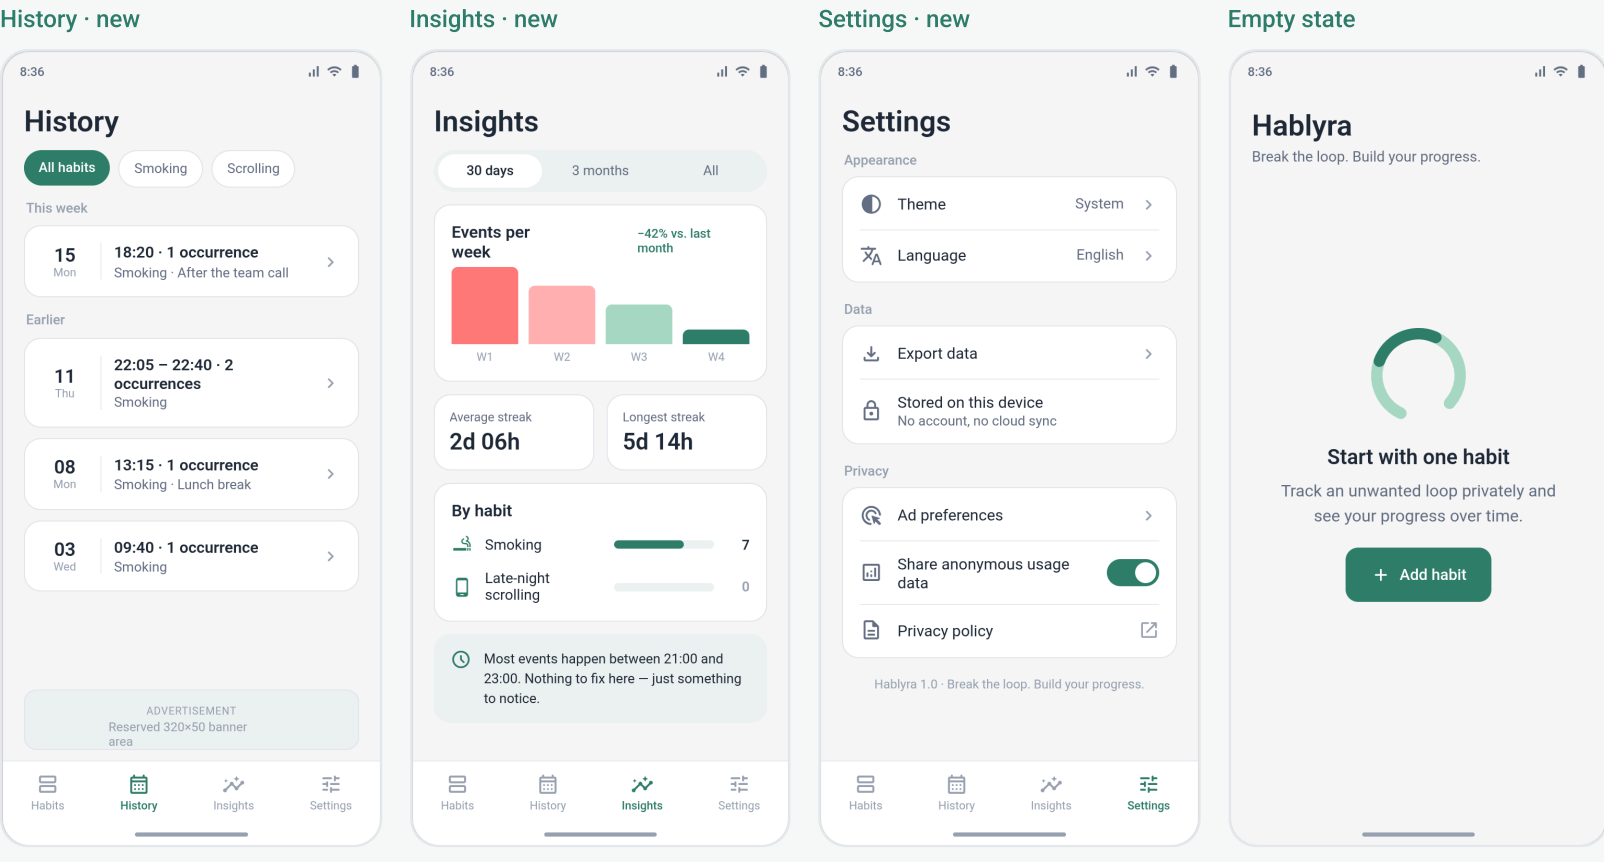

04 Log event

Close instead of back, occurrences moved into a card with 52dp stepper buttons, and quick-time chips (Now / 1h ago / Yesterday / Pick) for retrospective logging without a dialog. Existing helper copy kept verbatim.

05 New screens

History and Insights lift content out of habit details into their own tabs; Settings is new surface (ship only the rows that are in scope — no dead rows). Empty state uses the strings that already exist in EnglishAppDashboardStrings.

Task order

1. RhythmStrip, SegmentedControl, LoopMark(progress) as standalone components
2. Dashboard — card, week summary, FAB, ad band
3. Habit details — header ring, segments, calendar, statistics list
4. Event logging — card structure, stepper, quick chips
5. Habit editing — icon grid fix, flattened sections
6. Bottom navigation shell + History tab
7. Insights tab
8. Settings tab
9. Empty states, dark-mode pass, 200% font-scale pass

Per DESIGN_SYSTEM.md §19 these stay separate commits — visual redesign, package rename, Firebase migration and ad integration must not be combined.
